

PR205 SLIDING DOOR

The electric sliding door is useful for loading a manual and foldable wheelchair into the car. This loading system can be combined with a loading arm, which can load a folded wheelchair inside the car, completely behind the driver seat. The sliding door is electrically driven by a push-button handset or a rocker switch set on the dashboard/B-pillar and fed by the car battery. Our sliding door is very solid and under an aesthetic point of view is very remarkable. If the car has to be put on sale, the door can be easily replaced. In case of emergency a security system stops the door automatically.
