

AEM04 DOOR OPERATOR

The door operator turns a manual sliding door into an electric powered door via an electric motor. You can control this movement by a switch, or a push-button handset or by a wireless radio control.

It is provided with security systems:

- when the ignition is switched on, you can neither open nor close the door electrically
- If there is an obstacle in the way, the door operation is immediately stopped by both mechanical and electrical safety devices
- should a fault occur, you can still use the door manually.

After the installation of the device, the door can, at any time, be opened manually, just like in the original version.
